

Sintered Samarium Cobalt Magnets (SmCo)

Sintex a/s supplies both sintered and polymer-bonded permanent magnets. All magnets are customised - or in other words - magnets are developed and manufactured on the basis of a customers sketch.

Material and production

SmCo magnets are produced by powder compaction followed by a sintering process.

Mainly because of the cobalt contents of the magnets, these types of magnets are a more expensive solution. They are for example much more expensive than sintered NdFeB magnets, which typically have the same magnetic strength.

Samarium cobalt magnets do not corrode easily but for medium to very corrosive environments, some kind of surface treatment or sealing is recommended.

Possibilities and advantages

Besides being especially qualified for extremely high temperatures – typically up to 250-350°C - samarium cobalt magnets have the following advantages:

- High magnetic strength (Same range as sint. NdFeB)
- High resistance to demagnetization
- Very high working temperature
- High temperature stability
- Good corrosion resistance

Characterising magnets

The most important properties to take into consideration for characterising the magnets are:

- Magnetic properties such as remanence Br, coercivity Hcb, intrinsic coercivity Hcj and max. energy product (B•H)max
- Dimensions and tolerances
- Force (for holding magnets), Torque (for motors), Field strength (for sensors)
- Minimum and maximum operating and working temperatures
- Area of application usage – e.g. aquatic environment
- Requirements concerning surface coating

Results

The magnetic and mechanical data shown in this data sheet are the result of tests and calculations done on untreated magnet blocks.

Before you use the information and results, you are encouraged to seek personal assistance and advice from the magnet specialists at Sintex a/s.

Please contact us for more information.
